

iEDeX Platform

UpNet is an experienced innovator in providing data integration and transformation technology. Our iEDeX platform and services automatically translate and transfer customer specific data. The unique transformation ability means that typical EDI limitations are removed, giving your data the agility it requires to meet your ever changing business needs. With unprecedented speed, service quality and transparency, UpNet allows you to do business with any size trading partner and improves your business relationships through increased accuracy and ease of use.

“The advanced integrated process/platform approach allows UpNet to deliver unprecedented speed and more accurate insight of information to technology leaders...”

Innovative Technology

UpNet’s underlying technology is iEDeX, an innovative technology developed to facilitate data integration and data transformation. In addition to business process integration, iEDeX provides a real-time universal platform for B2B collaboration of event-based data. This true many-to-many network service securely transfers data in near real-time. Utilizing an integrated process and platform, iEDeX first deconstructs the data into its most basic form, translates it into a universal language, and finally connects the data to any receiving system. This flexibility allows iEDeX to move at the speed of your business.

UpNet’s iEDeX platform as a service (PaaS) leverages a suite of business applications to enable process management and collaboration. Currently the suite includes order management, logistics network manager, customer purchasing gateway, supplier relationship manager, business analytics, and status 411. The suite provides automation to your business, creating increased efficiency and effectiveness through control and compliance.

UpNet's iEDeX Platform provides a unique set of features that bring increased value and functionality to streamline business processes without the need for expensive software, hardware or staff. The advanced integrated process/platform approach allows UpNet to deliver unprecedented speed and more accurate insight of information to technology leaders who need data from disparate systems to co-exist in real time.

Fast to Connect: Can be connected in hours rather than months.

Fast to Deploy: Translation and communication happens in near-real time, ensuring data security and integrity.

Non-Invasive: iEDeX does not require your system to do anything different.

Universal Translation: Translates between any operating system, ERP, program or application.

Completely Compliant: iEDeX can support data communication and translation to meet any required standards or regulation.

Scalable: iEDeX scales with no additional programming time or staffing energy to meet your growing business needs.

Transparent: All aspects of the translation and communication are completely transparent.

iEDeX

How it Works

Integration and On-boarding: iEDeX needs to understand what data will be exchanged, the format in which it will be sent, and when it will be sent. Leveraging iEDeX, this process can be accomplished in a fraction of the time required for traditional methodology.

Universal Language: Breaking the data into its elements, iEDeX can match the data to its unique data dictionary and create a universal language instead of simply moving documents between systems. The universal language allows the communication and translation process to happen instantaneously, while ensuring security and data integrity.

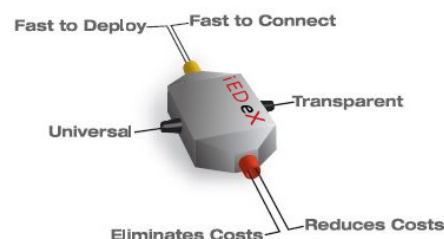

Event-Based: Events can be any trigger such as an introduction of new data or a periodic occurrence of data. By building the collaboration of data on the foundation of events, rather than business processes, iEDeX supports changes to both business processes and the desired outcome in a non-invasive fashion. This dynamic approach provides unprecedented flexibility to enable B2B collaboration.

Many-to-Many: In a true many-to-many platform, there are no one-to-one unique maps translating data between systems. Through the universal language a trading partner's system only requires a single connection to the iEDeX platform gaining access to the UpNet trading partner network. Once connected, the ability to have real-time data collaboration with any other partner(s) on the network is available.

Features:

- Fast to Connect
- Fast to Deploy
- Non-Invasive
- Universal Translation
- Completely Compliant
- Scalable
- Transparent
- Reduce Costs

The Unique Features of iEDeX Technology

Capabilities:

- Many-to-Many
- Real-time Monitoring
- Parallel Deployment
- Real-time Exchange
- Standard Compliance
- Online Visibility
